World Population Rising Daily

The world's people are multiplying at the fastest rate in all history.

Latest United Nations world census figures indicate that about 75,000 more people show up every morning and breakfast tables around the world. That means there are about 70,000 more births than deaths each day.

The United Nations Population Yearbook estimates about 2,600,000 more people now are on the earth.

There's a net increase of about 26,000,000 people a year.

Measured in census figures for United States alone this means:

Every day the increase almost equals the total of all people living in Binghamton, N. Y.

Every week in almost equal to everyone in New Orleans, La.

Every month it exceeds the population of Philadelphia, Pa.

In a year it adds up to the population of three times the size of New York, or of a nation equal to Mexico.

If the expansion continues at its present rate the world will be three billion people with people in 1975 years, experts estimate.

Some population authorities assume that man lived on earth about 100,000 years and estimate his numbers increased only to around 200,000,000 or 300,000,000 by the time of Christ. This period would represent about 98 per cent of mankind's existence. If the calculations are correct, there are now about 70,000 more births than deaths each day.

While the United Nations Yearbook contains around 600 pages of detail about world populations, the figures are not all based on a 100,000,000
